

Copy/Paste & Request Medical Examiner to do ASAP From CircleofMamas Autopsy Protocol

- **Test for C-reactive protein:** if inflammation is high, that would indicate vaccines were to blame as a small infant or toddler could not generate such results. This would indicate severe brain inflammation.
- **Test for liver enzymes**
- **Test for formaldehyde and Formalin**—in particular—which would come from vaccines. Even though the body manufactures a little formaldehyde, large amounts would implicate formaldehyde, or Formalin, especially in vaccines.

Run a cytokine panel:

1. **Interleukin-1 beta (IL-1 β)** — IL-1beta is one of the key mediators of the inflammatory response to physical stress.
2. **Interleukin-6 (IL-6)**
3. **Interleukin-8 (IL-8)**
4. **Tumor necrosis factor alpha (TNF- α)** TNF- α is a growth factor for immune cells and osteoclasts, the cells that break down bone.
5. **Fibrinogen**
6. **Vitamin C assay**
7. **Titer levels on all the vaccines.** If they are sky high, that could make a case for molecular mimicry causing death.

THESE ABOVE TESTS NEED TO BE RUN ON BLOOD SERUM, ASAP!!

Brain Tissue Samples Preserved as Paraffin Blocks

- **Brainstem: Pons, Medulla, Midbrain**
- **Hippocampus**
- **Cerebellum**
- **Cerebrum**
- **Spinal Cord**

The office will make H&E stained slides for your independent neuropathologist to review, this is a mess free way of replicating the tissue for study. You will want these tissues released from the facility to your independent neuropathologist if they do not provide a good amount of the H&E stained slides. Request that you want slides of every angle of every single tissue.
